

# Technical Bulletin

Model(s)	Year	Eng. Code	Trans. Code	VIN Range From	VIN Range To
All except Routan	2000-2015	All	All	All	All

## Condition

27 15 03 March 12, 2015 2016076 Supersedes Technical Bulletin V271105 dated December 15, 2011 to include additional models and model year applicability.

**Battery, Discharged, Diagnosis for Excessive Static Current Draw**

## Technical Background

One or more of the following symptoms is possible.

- Discharged battery
- Engine does not start because of low battery voltage
- Voltage display in the combination instrument displays too low
- "Low battery" fault codes in various control modules

## Production Solution

N/A.

## Service

### Tip:

Refer to Elsa for other Technical Bulletins that apply to specific vehicles with discharged batteries. These Technical Bulletins provide information about intermittent faults and correct battery testing /charging procedures.

### Note:

Perform **ALL STEPS**, to systematically test for faults and to avoid repeat repairs.

### Note:

The power supply to vehicle must not be cut off. **DO NOT** perform terminal 30 reset. **DO NOT** remove or disconnect battery, battery cables or fuses.

# Technical Bulletin

---

Check the fault memory.

- Compare control units on the fault memory print-out with vehicle equipment (PR numbers). Are all necessary control units listed on the print-out? Any control units not listed may be faulty and could be indications for the further fault finding.
- Check which non-genuine parts are installed, e.g. tow bar, animal protection, radio, DVD, etc. If an increased closed-circuit current is found, check these components first.

## Step 1: Verify Battery Condition

1. Connect Midtronics INC-940 or GRX3000VAS to battery.
2. Check and/or charge battery based on applicable Technical Bulletin.
3. If INC-940 or GRX3000VAS test fails battery, replace battery before continuing.

## Step 2: Verify Sleep State Current

1. Connect 50 amp current clamp to appropriate VAS Diagnostic tool.
2. Calibrate the current clamp.
3. Connect current clamp to negative battery cable with arrow pointing away from battery.

### Tip:

Current flows out of the battery to the chassis of the vehicle

4. Close all doors, trunk, or hood latch so vehicle control units detect all doors closed.
5. Arm vehicle anti-theft system with remote.

### Tip:

- If vehicle has easy entry handles then it is necessary to keep clear of all handles to avoid bus communication/wakeup message.
- On vehicles equipped with air suspension, after engine is turned off, the system will stay in standby for up to five minutes

6. Observe sleep state current draw after vehicle is left untouched for **TWO HOURS**.

Vehicle:	Phaeton	All other models
Nominal sleep current:	50 mA	40 mA

7. If after two hours the vehicle exceeds maximum sleep state current draw, proceed to **Step 3: Consuming Circuit Isolation**. If vehicle does not exceed maximum sleep state current draw, perform a long term (overnight) measurement test. Record the *long term measurement* using MIN/MAX setting of scan tool.

# Technical Bulletin

---

 **Tip:**

Periodic spikes in current draw are normal

### Step 3: Consuming Circuit Isolation

 **Tip:**

Due to the state of the CAN Bus communications in the vehicle, it is no longer acceptable to pull each individual fuse one at a time to try and identify which circuit is consuming current. Removal/ reinsertion of a fuse while vehicle is in a sleep state may wake the bus of the vehicle, and invalidate the test. Identifying "consuming" circuits must be done by measuring a voltage drop across fuse and aligning with the value in matrix located at end of this document.

**Starting at interior fuse boxes, perform the following tasks:**

 **Tip:**

Use VAS multimeter function, Fluke 83 multimeter, or equivalent.

- Use "mV" scale on meter
- Measure voltage drop across fuse by placing the positive lead on one side of the fuse and negative lead on other side.

- Take absolute value of reading of voltage drop (ignore negative signs) and then reference voltage drop chart to determine how much current the circuit is currently consuming. See **Identifying Current Consumption with Matrix** attachment.
- Check all fuses until fuse with approximate excessive current draw is identified

#### Identification of component:

1. Once fused circuit is identified, use service repair and wiring diagram information in Elsa to identify all components on circuit.
2. Disconnect components from the circuit one by one and allow sleep current to stabilize after each elimination.
3. Measure vehicle current consumption and voltage drop across fuse once again. If within normal range, as specified in the table (see **Current Consumption Matrix** attachment), the component with excessive consumption is identified.
4. Repeat steps above until component is identified causing excessive current draw.

## Warranty

Information only.

## Required Parts and Tools

No Special Parts required.

No Special Tools required.

## Additional Information

**All part and service references provided in this Technical Bulletin are subject to change and/or removal. Always check with your Parts Dept. and Repair Manuals for the latest information.**

## Identifying Current Consumption with Matrix

- What is needed:
  - Measured voltage drop across fuse in mV
  - Fuse type
  - Fuse rating

Measurement mV	Mini 5	Mini 7.5	Mini 10	Standard 5	Standard 10	Standard 15	Standard 20	Standard 25	Standard 30
0.1	6	10	14	7	13	23	30	47	62
0.2	12	20	28	13	27	45	61	94	123
0.3	18	30	43	20	40	68	91	141	185
0.4	24	40	57	26	54	91	122	188	246
0.5	30	50	71	33	67	113	152	235	308

← Fuse type  
 ← Fuse rating  
 ← 20 mA

↑  
 Measured voltage  
 drop across fuse

**Example:**

- Measured voltage drop = .3 mV
- Fuse type = Standard
- Fuse rating = 5 A

*Current consumption through circuit = 20 mA*

## Current Consumption Matrix
