

Fog Light Lenses Look Melted or Discolored?

AFFECTED VEHICLES

All models with fog lights

Do the fog light lenses look melted or discolored? Before you consider fog light replacement, check the lenses for aftermarket stone chip protectors.

These products help protect headlight and fog light lenses from rock chips, bugs, sand, salt, and other everyday driving hazards. But in some cases, they can melt or get discolored, making it look like the lenses are damaged when they actually aren't.

If the lenses have these protectors, **don't** replace the fog lights! Contact the service advisor. If you replace the fog lights and WPI later determines that the **only** damage is to the protectors, your dealership will be debited! Damage to aftermarket parts **isn't** covered by Warranty.

Of course, if the lenses **don't** have these protectors and they're actually melted or discolored, then fog light replacement is certainly a consideration.
