The Vehicle Overspeed Threshold is set with parameter (VECU4) ZX5, (VECU5) P1UWE and Driver overspeed warning default trigger is set with parameter ROS. These parameters may be set at a low enough value that road speed limit is higher. This issue is most likely to occur following changes made to the road speed limit with pedal and/or cruise.

If the vehicle overspeed alert is activating at too low of a speed on a VECU4 chassis follow steps below:

1. In Premium Tech Tool (PTT), run Operation [1700-22-03-03 Parameter Programming](#). The Operation can be found under the Program tab.
2. Locate and review the value of parameters specified below:

VECU4	VECU5
ZX5	P1UWE
ROS	P1C7R
	ROS

Z10	LOV Idle Warning Threshold	112.747474	0.0000000000	0.0000000000	r/min
ZXA	LOV Engine Overspeed Company Threshold	500.000	0.000	3500.000	r/min
ZX5	Vehicle Overspeed Threshold	0.00000000	86.000	158.452085	mph
ZXZ	Vehicle Overspeed Air Threshold	0.00000000	0.0000000000	158.452085	mph
ZMA	Fuelled Engine Overspeed Threshold	500.000	0.000	3500.000	r/min

3. Set the value for the parameters listed above higher than the values for the other road speed limits.

Note: The maximum value that the specified parameters should be set to is 86 mph (138 km/h). Setting the value higher may cause other issues.
